

Task 2: Test log

Description of test	Test data to be used (if required)	Expected outcome	Actual outcome	Comments and intended actions
Version 1: Load up test	n/a	Page will load as expected.	Page loaded as expected	Change css to match the design better, Add functionality for register and login
Version 1: Register test initial test	Email: emma.wilson@testmail.local Password: TestPass!2024	User account will be created successfully, User will be sent to login page to login to the account, data will be added to the database.	Page went to 404 not found, no data was added to the database. (see test 1.1 on test evidence)	Figure out what is causing the 404 error and come back to it.

Version 1: 1.2 Register test testing to see if the system will work after file paths were corrected after first initial test	Email: emma.wilson@testmail.local Password: TestPass!2024	User account will be created successfully, User will be sent to login page to login to the account, data will be added to the database.	Error displayed: ERROR: could not find driver	Issue has been identified as a technical issue with the database (laragon) setup. Issue was resolved by tutor
Version 1: 1.2 Register test After the technical issue was resolved, testing the system to insure it works as intended	Email: emma.wilson@testmail.local Password: TestPass!2024	User account will be created successfully, User will be sent to login page to login to the account, data will be added to the database.	As intended, user was redirected to login page with a success message of account creation, account was successfully added to the database.	Develop and test login system.
Version 1: 1.3 Login	Email:	User will login and be	Page went to a 404	Solve the issue

test Initial test	emma.wilson@testmail.local Password: TestPass! 2024	sent to the user dashboard with a message of success.	(Page not found) error	causing the 404 error. predictably, incorrect file paths like with register.
----------------------	---	---	------------------------	--

Version 1: 1.3 Login test testing to see if the system will work after file paths were corrected after first initial test	Email: emma.wilson@testmail.local Password: TestPass! 2024	User will login and be sent to the user dashboard with a message of success.	As intended, test was successful. Logging user in with a displayed success message on the user_dash page and an updated navigation bar for the logged in user.	Move on to 1.4 user logout.
Version 1: 1.4 Logout test	Email: emma.wilson@testmail.local	From the user dashboard, clicking logout will log the	As predicted with a displayed user message:	Move onto version 2

initial test to see if user is logged out successfully.	Password: TestPass!2024	user out and send them back to the index page (logged out)	"you have been logged out!"	
Version 2: Register audit test initial test	Email: james.carter@fakemail.site Password: Secure123#xyz	When a user registers, an audit will be added to the system saying they have registered their account	"ERROR: SQLSTATE[42S22]: Column not found: 1054 Unknown column 'longdesc' in 'field list' " appeared, user account was still created	Check to ensure that the naming conventions in the function match up with the database.
Version 2: Register audit test testing to see if fixing naming conventions fix the problem	Email: sophia.renolds@demo-example.com Password: DemoPass!987	When a user registers, an audit will be added to the system saying they have registered their account	"ERROR: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'user_id' cannot be null "	Something is going wrong with the function "getnewuserid" which should receive a new users user id from

			received error above. the database User account was created, user_audit not created.	
Version 2: Register audit test testing to see if fix in getnewuserid has fixed problem	Email: noahpatel@mockdata.org Password: FakeUser\$500	When a user registers, an audit will be added to the system saying they have registered their account	User was created successfully and taken to login page as intended, an audit was created successfully	Move onto the login system.
Version 2: login audit test initial test	Email: james.carter@fakemail.site Password: Secure123#xyz	Testing to ensure that when a user logs into the system is logged in the audit table	"ERROR: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'user_id' cannot be null" User was logged in	Change naming conventions to see if it works

			successfully but audit was not created	
Version 2: login audit test testing to see if fixing naming conventions fix the problem	Email: emma.wilson@testmail.local Password: TestPass! 2024	Testing to ensure that when a user logs into the system is logged in the audit table	User was successfully logged in, an audit was created to reflect that	Move onto the logout audit system
Version 2: logout audit test initial test	Email: emma.wilson@testmail.local Password: TestPass! 2024	Testing to ensure that when a user logs out of the system is logged in the audit table	User was logged out successfully, Audit was added to the audit system.	

Version 2: product display test initial test	n/a	Testing to see if the products will be taken from the database and displayed accordingly, with css being applied	Products were displayed correctly but JPEG images are sized to big, making it hard to see details.	Convert the JPEG images into JPG so they will be compatible with the css
Version 2: add items to basket	n/a	Testing if when a user clicks add to basket, It will be added to their basket	Nothing happens	Find out why nothing happens, update code
Version 2: add items to basket	n/a	Testing if when a user clicks add to basket, It will be added to their basket	A message is outputted to the user but basket page is broken.	Fix the basket page so you can see it displayed

Version 2: add items to basket	n/a	Testing if when a user clicks add to basket, It will be added to their basket	Items are now added to basket but some naming conventions need changing to be correct	Fix naming conventions and ensure it works properly, remove unnecessary code
Version 2: add items to basket	n/a	Testing if when a user clicks add to basket, It will be added to their basket	After fixing naming conventions, it works as intended. You can see all the data needed.	Test to ensure you can change the quantity and delete items from the basket
Version 2: change quantity of item in basket	n/a	Quantity, subtotal of item will be updated and message will be sent to the user	As intended	Test items are deleted successfully

Version 2: delete item from basket	n/a	Item will be removed from the basket, total will be updated to reflect that	As intended. Items can also be re-added successfully after being removed.	Continue on to completing orders
Version 2: complete order initial test	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item will go down and an order will be added to the database.	Error: SQLSTATE[42000]: Syntax error or access violation: 1064 there is an issue with the stock control system, this is preventing the order from being completed correctly	Fix the issue with the stock control system.
Version 2: complete order	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item	Error: SQLSTATE[42S02]:	After checking the table name in the database. It is orders

the table name "order" was causing a syntax error, put them in backticks.		will go down and an order will be added to the database.	Base table or view not found: 1146 Table 'glh_db.order' doesn't exist	not order. Order causing a syntax error hid the real issue. Sql statement will be adjusted.
Version 2: complete order attempting to order again after adjusting sql statement to have the correct naming conventions	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item will go down and an order will be added to the database.	Error: SQLSTATE[42000]: Syntax error or access violation: 1142 INSERT command denied to user 'glh_select'@'localhost' for table 'orders' I have used the wrong database connection for the database connection. I was supposed to use glh_insert	Update the code to use the correct database connection for inserting data.

Version 2: complete order testing again after correcting database connection to insert instead of select	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item will go down and an order will be added to the database.	Error: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'user_id' cannot be null something is wrong where the user_id is not being sent to the database	Find out what is causing this issue and correct it.
Version 2: complete order fixed issue with user id.	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item will go down and an order will be added	Error: SQLSTATE[42000]: Syntax error or access violation: 1064	Fix the add_basket function

		to the database.	there is an issue with the add_basket function.	
Version 2: complete order missing) on sql statement. Fixed, now trying again.	Type: delivery date: 29/ 03/ 2026	Items will be ordered, stock in the database for the item will go down and an order will be added to the database.	Error: SQLSTATE[23000]: Integrity constraint violation: 1452 Cannot add or update a child row: a foreign key constraint fails (`glh_db`.`basket`, CONSTRAINT `basket_ibfk_1` FOREIGN KEY (`order_id`) REFERENCES `orders` (`order_id`) ON DELETE CASCADE ON UPDATE CASCADE)	Issue in the add_basket function. Fix issue and retest.

			This error was received. Some of the data was committed to the database. (order was repeated, not all the items in the basket were entered into the database, basket did not clear after order was completed).	
Version 2: complete order retest after weekend	Products: mince (id=2), cheese (id=3) collection, 01/04/2026	Items will be ordered, stock in the database for the item will go down and an order will be added to the database.	Order is successful but in the database, the order id and product id is flipped. Setting orders and products with the wrong id number. Without solving this will be a serious issue if implemented into a	Check the function and fix what is causing the ids to be flipped.

			real solution	
Version 2: complete order test after fixing issue	Products: mince (id=2), cheese (id=3) collection, 01/04/2026	Items will be added to the database as intended with the ids corresponding to the correct columns.	Working as intended. In the execute statement the itemid and orderid were backwards.	Update the audit system to audit when users order products.
Version 2: order audit system	n/a	After a user adds an item to basket, updates its quantity, removes an item and completes an order. An audit will be added to the user_audit table	As intended.	Move onto version 3

Version 3: view orders initial test	n/a	Orders will display as intended split with current and past orders	At first, the current and past orders labels repeated because they were in the foreach loop with the orders. To resolve this, I made 2 foreach loops. One for current orders and one for past orders.	Move onto stock management so that when users alter or delete products then the stock can be maintained properly
Version 3: stock management initial test	n/a	The stock management system will check to see if each item in a users basket is in stock, if they all are then the order will complete successfully. With the stock being updated in the database to	Error: SQLSTATE[HY093]: Invalid parameter number: number of bound variables does not match number of tokens something is wrong with my sql	Fix the issue causing stock to not be updated.

		reflect the changes.	statement in remove stock. Removed values and tried again. Order was successful but quantity in the products table was not updated.	
Version 3: stock management The table name for the remove stock sql statement was the wrong table (basket instead of product). This meant I accidentally removed the quantity of items from all the order items stored in	n/a	The stock management system will check to see if each item in a users basket is in stock, if they all are then the order will complete successfully. With the stock being updated in the database to reflect the changes.	Order was successful but the product table quantities did not update. Asfter testing the sql statement again, I am assuming it may be a problem with permissions with dbconn_update(). I have temporarily given update the ability to insert, select, update and	Go back to alter and delete orders

basket. This proves the importance of test data and testing the system before you release it for public use.			delete data to see if this fixes the issue. That still did not fix the issue so there is something wrong within my code. To fix the problem, I immitated the add basket function with a foreach loop to see if it solves the problem. This led to the stock being successfully updated.	
Verison 3: adding products on single page	n/a	After adding the code from products the page should run the same, adding the product to cart	For some reason, add to basket now adds 1 to the product id, meaning the wrong product is being added to the cart. I went back to version	Move onto loyalty scheme before going back to altering and deleting orders.

			2 and the add to basket system is completely broken. After testing, I discovered there is something wrong with the array it is in. the array is not set as a proper associative array because it pulled from the database so now it is put into a new array to combat that.	
Verison 3: adding an account to the loyalty scheme	Email: test@email.com password: test	When a user registers an account they will receive 10 loyalty points as part of the loyalty	User was registered successfully, with a loyalty account created.	Move onto displaying points to a user.

		scheme. When a user registers they will get added into the loyalty table where all points will be dealt with.		
Version 3: cancelling orders	n/a	When a user cancels an order, the order in the basket and order table will be removed.	ERROR: SQLSTATE[42000]: Syntax error or access violation: 1064 my sql statement doesn't work. After fixing the statement by separating them into 2 separate statements. The system works but stock and loyalty points are not	Add functionality to return stock amount and remove loyalty points.

			returned	
Verison 3: returning stock and removing loyalty points	n/a	When a user cancels an order, the stock will be updated to return the stock, the user will have the loyalty points they received removed and the stock will be updated to reflect the cancellation	The stock did not return to the correct quantity and the loyalty points were completely replaced with the amount that was supposed to be taken away. After changing the add stock function it removed the errors but does not function. After making quantity and product id there own arrays. It functioned as intended. After removing the	Move onto testing the entire system to find and solve any bugs.

			points variable and changing the system to session in the total points that should be removed for the order it worked as intended	
Version 3: register system testing email verification	Normal: email: normal@test.com password: test Erroneous: email: normal@test.com password:	Normal: account will be created expected erroneous: accounts will fail to be created extreme: account will be created	Normal: accounth was created as expected, user taken to login page erroneous: repeating account was created. Fake email did not work, did submit though extreme: account was created	Fix erroneous issues. - no user message with failed register attempt – proper messaging on chrome, just how fire fox works. - allowing duplicate accounts – moved reg_user into its own if statement, added error messages, now

	test email: errortest.com password: test extreme: email: verylongemailaddress _thatis_definitely_over _64_characters_long @example.com password; test		successfully	works as intended.
Version 3: login system testing email verification	Normal: email: normal@test.com	Normal: user will be logged in as normal	Normal: user logged in successfully	Fix the redirection problem – unsure why user is being redirected to the

	password: test Erroneous: email: no@exist.com password: test email: errortest.com password: test extreme: email: verylongemailaddress_thatis_definitely_over_64_characters_long@example.com	erroneous: user will fail to log in extreme: user will be logged in as normal	Erroneous: displays message: user not found, redirected (will change, may confuse user) Extreme: logged in as intended	index, code shows they should be redirected to the login page. Found problem in the login function. Now fixed
--	--	---	--	---

	password; test			
Version 3: basket and order system testing	n/a	Normal: user will be able to add new items to their basket Erroneous: users will not be allowed to add items to basket that they already have in the basket. User will not be allowed to order for a past date Extreme:	Normal: as intended Erroneous: If na item is out of stock, system wont let it be added to basket – needs proper communication to the user users can order order products for dates that have already passed – needs fixing	Change system so that items will say out of stock – add to basket button now says sold out. make it so users can't order products in the past – users can no longer order products in the past or for the current date.

		user will be allowed to order all items in stock.	Extreme: as intended	
Version 4: 4.2 register system initial test	Email: test@greenfield.com type: admin Password: test	Staff account will be registered and added to the database with a success message but without being redirected (that is for now until further development)	ERROR: SQLSTATE[HY093] : Invalid parameter number: number of bound variables does not match number of tokens there is something wrong with my sql statement. The paramerters are	Fix the parameters and retest.

			wrong.	
Version 4: 4.2 register system test after fix	Email: test@greenfield.com type: admin Password: test	Staff account will be registered and added to the database with a success message but without being redirected (that is for now until further development)	ERROR: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'staff_id' cannot be null A staff account was logged into the database during this test so I am assuming there is an issue when trying to audit the system to say the account was created.	Due to the error caused, it will be left unfixed until later. (see testing evidence for further details) Moving onto login system for now.

Version 4: 4.1 Login System initial test	Email: test@greenfield.com Password: test	Staff account will be logged in successfully with user being redirected to their staff dashboard	ERROR: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'staff_id' cannot be null After receiving the same error as before there may be a more serious issue with the audit system then originally thought.	See what is wrong with the audit system before retesting. with same details as before. Worked as intended after fix. (see testing evidence)
Version 4: 4.2 register system test after fixing login	Email: store@greenfield.com type: Store Staff	A new staff account will be registered to the system with an audit showing the staff id of the admin staff that made the	As intended. Account was successfully created with an audit to the id of the admin account that created the account	Move onto 4.3 updating product Quantities.

	Password: test	account.		
Version 4: 4.5 logout system Initial test	staff_id: 1	When a staff logs out they will be redirected back to the staff login page with a message saying they have logged out. An audit will be made to reflect the logout.	Logout was successful with an audit made but no message was displayed to the user. After testing it was discovered that the staff_login page had the wrong user message system. Now corrected and working (see testing evidence for more details)	Check the login user message to ensure it is there and working. Move onto 4.3 updating product Quantities.

Version 4: 4.4 Adding new products farm display test	n/a	When the form opens the farms will have a drop down menu that links to the database and lets a user select a farm	The page didn't load. After putting the farm code in a try catch it loaded but displayed an sql error saying the table didn't exist (see testing evidence) to fix this I made sure the name of the table in the sql table was correct and code executed as intended.	Continue on to adding functionality to adding products to the database.
Version 4: 4.4 Adding new products inserting new product test	Name: fresh Baguette desc: [INSERT DESCRIPTION HERE] farm: golden vale	Products will be added to the database as intended with an audit and success message	ERROR: SQLSTATE[23000]: Integrity constraint violation: 1048 Column 'image_alt' cannot be null	The image alt tag is null, this means the data for it was not taken to the sql statement properly. Im assuming I have spelt the name wrong

	produce img: baguette.png img_alt: a fresh baguette price: £2.30 quan: 25			somewhere. I had put an unnecessary _ in its name which made it not work. After retrying no message was displayed but data was added to the database as intended. This was caused by another miss-spelling when calling to the user message due to auto filling code.
Version 4: 4.3 updating product quantity initial test	n/a	Product quantity will update in the database with whatever number is entered	As intended	Update and finish everything off.

Version 4: 4.5 testing is store staff can access update quantity	n/a	Store staff should be given access to the update quantity page and be allowed to use it.	User was not allowed access despite having the right access. After changing the or in the statement to and, It worked as intended.	Move onto updating product description then documentation.

--	--	--	--	--
